

The Universal Press Button Fountain Roller is designed with a self-contained ink reservoir in the handle for efficient production stenciling applications. The refillable reservoir holds 4.2 oz. (125 ml) of ink and the precision valve delivers the ink directly to the surface of the roller with the press of a button. Since the Universal system delivers the ink direct to the roll surface, response time is almost instantaneous when more ink is needed on the stencil.

PBFR-31 PRESS BUTTON UNIT WITH PBFR-32 ROLLER

This product is manufactured from precision machined aluminum components and utilizes o-ring seals for leak proof operation. The entire unit can be completely disassembled if cleaning or repair becomes necessary. Universal Type P ink is recommended for stenciling on porous surfaces such as corrugated cartons and paper products.

The Press Button unit can be used with TYPE D ink for non-porous stenciling but it is only recommended where stenciling volume is high with regular daily use. For low volume non-porous applications we recommend the Roll-A-Stencil Jr. systems.

After prolonged use, the foam rollers on any stencil roller applicator will become worn from abrasion and clogged with pigment residue. The PBFR-33 Felt Wicks which feed ink to the roller surface also become clogged with pigment after extended use. When the roller shows signs of excessive wear or begins to perform poorly, it should be replaced and a new felt wick should be installed.

PRESS BUTTON FOUNTAIN REPLACEMENT ROLLER
